

1. Laundry Technology:

Using cold water only, the water is infused with oxygen and peroxides with silver ions to lift dirt and grime from cloth fibers. Saves money and helps protect the environment.

2. Electrical Power Conditioning System:

Whole home electrical power conditioning system installs near the breaker box and provides surge and spike protection, reduction of electrical line noise, and conserves energy by optimizing the power factor.

3. Air Purification:

According to the EPA, as our homes become more airtight, indoor air pollution can become a major issue. Indoor air purification technology destroys odors, kills harmful bacteria, eliminates smoke and reduces allergy- and asthma-causing contaminants from the air.
